Role of constitutional homoeopathic treatment in primary dysmenorrhea: A case report

Dr. Keerti Pathak

Abstract
Dysmenorrhea is the most common gynecological problem among females. Primary dysmenorrhea refers to one that is not associated with any identifiable pelvic pathology. It affects more than 50% postpubescent women in the age group of 18-25 years with ovulatory cycles. A 26 years old unmarried Hindu female reported with the complaints of pain in the lower abdomen and thighs before and during menses since menarche. She could not go to office during first day of menses. Abdominal and pelvic examination did not reveal any abnormal findings and Visual Analog Scale was used for assessment of pain. A complete case history was taken and on the basis of individualization, Natrum muriaticum was given. This case justifies the Kent’s 11th observation i.e. ‘When old symptoms are observed to reappear [1].’ It shows the effect of constitutional homoeopathic medicine in the treatment of primary dysmenorrhea.

Keywords: Primary dysmenorrhoea, homoeopathy, natrum muriaticum, ignatia amara, sephia, radar

Introduction
Dysmenorrhea literally means painful menstruation. But a more realistic and practical definition includes cases of painful menstruation of sufficient magnitude so as to incapacitate day to day activities [1]. It is the leading cause of gynecological morbidity in women of reproductive age regardless of age, nationality and economic status [3]. Thus the World Health Organization estimated that dysmenorrhea is the most important cause of chronic pelvic pain [4].

Etiology
Patients can be classified into groups for understanding the pathogenesis of this distressing condition [2].

Primary dysmenorrhea: refers to one that is not associated with any identifiable pelvic pathology. It affects more than 50% postpubescent women in the age group of 18-25 years with ovulatory cycles [2].

Secondary dysmenorrhea: refers to the one associated with the presence of organic pelvic pathology, i.e. fibroids, adenomyosis, Pelvic Inflammatory disease (PID) and endometriosis. It is also seen in some women wearing intrauterine contraceptive device (IUCD) and in cases of cervical stenosis [2].

Causes of pain in Primary dysmenorrhea (Spasmodic)
The mechanism of initiation of uterine pain in primary dysmenorrhea is difficult to establish. But the following are too often related –
• Mostly confined to adolescents.
• Almost always confined to ovulatory cycles.
• The pain is usually cured following pregnancy and vaginal delivery.
• The pain is related to dysrhythmic uterine contraction and uterine hypoxia.
• Psychosomatic factors of tension and anxiety during adolescence; lower the pain threshold.
• Abnormal anatomical and functional aspect of myometrium.
• Imbalance in the autonomic nervous control of uterine muscles.
• Role of Prostaglandins—In ovulatory cycles, under the action of progesterone.
Prostaglandins are synthesized from the secretory endometrium. PGF2 alpha is a strong vasoconstrictor, which causes ischemia (angina) of the myometrium.

- Role of Vasopressin- There is increased vasopressin release during menstruation in women with primary dysmenorrhea. Vasopressin increases prostaglandin synthesis and also increase myometrial activity directly.
- Endothelins cause myometrial smooth muscle contractions, especially in the endomyometrial functional zone[1].

Clinical Features
Primary dysmenorrhea is widely prevalent, more than 50% of teenagers and 30 to 50% of menstruating women suffer from varying degree of discomfort. The severe incapacitating type which interferes with a women’s daily activities affect only 5 to 15% of the population. Its prevalence is higher amongst the more intelligent and sensitive working class women. Both the local and systematic symptoms are apparently the result of increased levels of PGF2 alpha in the menstrual fluid. This results in uterine cramping, nausea, vomiting, backache, diarrhea, giddiness, syncope and fainting. It is responsible for the highest incidence of absenteeism, resulting in loss of work hours and economical loss[2].

Case
A 26 years old unmarried Hindu female belonging to middle socio-economic status reported at Swasthyä Kalyan Homoeopathic Medical College and Research Centre, Sitapur, Jaipur on September 09, 2017 with the complaints of pain in the lower abdomen and thighs before and during menses since menarche but increased since last few months. Her LMP was 08 September 2017. She used to take painkillers (meftal spas) during first 3 days of menses. She could not go to office during first day of menses. The character of pain was spasmodic. Pain was ameliorated by warm applications (Hot water bag) and taking rest.

Clinical Findings: Her LMP was 08/09/17. Abdominal and pelvic examination did not reveal any abnormal findings. Patient complained of unbearable pain in lower abdomen and thighs. On Visual Analogue Scale, she ranked pain 9.

Past History: She had difficulty in breathing in 2010. She used inhalers and took steroids for the same complaints for one year. After suppression of respiratory complaints, she developed urticaria and angioedema. She took allopathic treatment with temporary relief.

Physical Generals: Patient used to take extra salt in food. She had unrefreshing sleep. Thermal reaction of the patient was hot. She was thirst less in spite of dryness of the tongue.

Mental Generals: She did not like company. She was responsible, she took responsibilities seriously. She was bike–rider. Her way of talking was mannish. She wore shirts and jeans only. She did not want to marry. She had an aversion to men and to physical relations. She used to say that she was different from other girls. Whenever she was upset, she did not like consolation.

Analysis
Mind
- Her way of talking was mannish.
- She used to take responsibilities seriously.
- She had an aversion to men.
- She did not want to marry.
- She used to say that she was different from other girls.
- She did not like company. She wanted to be alone.
- She did not like consolation.

Physicals
- Thirst less with dryness of the tongue.
- She used to take extra salt in food.
- Hot patient.
- Unrefreshing sleep.

Particulars
- Spasmodic Pain before and during menses.
- Painful menses ameliorated by warm application.

Evaluation
- Her way of talking was mannish.
- She used to take responsibilities seriously.
- She had an aversion to men.
- She had an aversion to physical relations.
- She used to say that she was different from other girls.
- She did not like company. She wanted to be alone.
- She did not like consolation.
- Thirst less with dryness of the tongue.
- She used to take extra salt in food.
- Unrefreshing sleep.
- Spasmodic Pain before and during menses.
- Painful menses ameliorated by warm application.
Repertorization

![Repertorization sheet](Synthesis Treasure Edition from RADAR R10.0)

**Fig 1:** Repertorization sheet (Synthesis Treasure Edition from RADAR 10.0) [5]

---

**Repertorization Analysis**

**Following medicines came on Repertorization**:
1. Natrum Muriaticum - 22/10
2. Calcarea Carbonica - 11/08
3. Pulsatilla - 13/06
4. Sepia - 12/06
5. Platina - 08/06

**Potential Differential Field**

As patient was hot, so Calcarea carbonica and Sepia were ruled out. Natrum muriaticum has aversion to company, coition, marriage, desire for salt, aggravation from consolation, mannish in nature, takes responsibility too seriously. So the best chosen indicated remedy was Natrum muriaticum.

**Treatment and management**

On the basis of miasmatic background of the disease and comparing the medicines of repertorial result with the help of materia medica, Natrum muriaticum was selected as Constitutional medicine. Natrum muriaticum 200 single dose stat was prescribed by placebo in the form of globules of 30 size. I prescribed Magnesium phosphorica 30/3 doses SOS along with Natrum muriaticum. I advised her to use hot water bag and to avoid Meftal spas or any kind of painkillers and psychological counselling was done.

</tbody>
</table>

**Conclusion**

Patient is still under observation and advised her to report in case of remission of complaints. This case shows the effective role of Homoeopathy in the treatment of primary dysmenorrhea. This case shows that how the constitutional remedy beautifully acts on the mental level. The patient had an aversion to men and did not want to marry. Now she got happily married on 12 May 2019. This case justifies the Kent’s 11th observation i.e. “When old symptoms are observed to reappear.” [10] This case also shows the theory of individualization is very important for the effective Homoeopathic treatment.
